

PELITON

How to Put Your New Website Online

A simple, step-by-step guide. Takes about 15 minutes. No tech skills needed.

Your new website is one file. You will **download it**, then **upload it** to where your website lives, and that's it. Just do the steps in order, from 1 to 8. You can't break anything — Step 4 makes a backup first.

Before you start, you need two things

1. Your website login

This is the login for your **hosting company** — the company you pay to keep peliton.com online. The screen you need is called **“File Manager”** (sometimes “cPanel”).

Don't know it? Call your hosting company and say: *“I need to log in to File Manager for peliton.com.”*

2. A computer with internet

A regular Windows or Mac computer. (Not a phone — uploading is much easier on a computer.)

Get the new website

↓ Click here to download the new website

<https://github.com/AIRSTIK/peliton-preview/raw/main/download/peliton-website-files.zip>

This saves one file called **peliton-website-files.zip** to your Downloads folder. **Do not open it or change it.** The pictures are already inside — you don't need anything else.

The 8 steps

1

Download the new website.

Click the green button above. A file named **peliton-website-files.zip** goes into your Downloads. Leave it as-is.

2

Log in to your File Manager.

Go to your hosting company's website and log in. Click the button called **File Manager**. (Not sure where it is? Call your hosting company and ask them to get you to “File Manager for peliton.com.”)

3

Open the **public_html** folder.

This is the folder where your website lives. Double-click it to open it. (On a few hosts it's called **www** or **htdocs** instead — same thing.)

4

Make a backup first. **SAFETY — don't skip**

Inside that folder, select everything (look for **Select All**). Click **Compress** → make a **.zip** → then **download** that zip to your computer and keep it somewhere safe. This is your “undo” button. Now nothing can be lost.

5

Upload the new website.

Click the **Upload** button. Choose the **peliton-website-files.zip** you downloaded in Step 1. Wait until it says **100% / Complete**, then go back to the **public_html** folder.

6

Unzip it on the server.

Right-click the **peliton-website-files.zip** you just uploaded and choose **Extract**. If it asks “**Overwrite?**” click **Yes** — that's what replaces the old site with the new one. When it's done, you can delete the leftover **.zip** to keep things tidy.

No “Extract” button on your screen? No problem. On your own computer, right-click the downloaded zip → **Extract All** to get 12 files. Then in Step 5 upload **all 12 files** instead of the zip, and click **Yes/Overwrite** if asked. Skip this step 6.

7

Look at your new website.

Go to **peliton.com**. Hold **Ctrl** + **Shift** + **R** (Windows) or **Cmd** + **Shift** + **R** (Mac) to force a fresh load. The new design should appear.

8

Check it on your phone too.

Open peliton.com on your phone. It's built to look great on phones, tablets, and computers.

Changed your mind, or something looks off? You can put the old site back anytime. Just upload the backup zip you made in **Step 4** the same way, extract it, and overwrite. Your old website is back. Nothing here is permanent.

Stuck on any step? I'm happy to help.
